The Pressure's OFF
Ford's CFT30

Over the past year, ATRA's Technical Department has been working feverishly to bring you the latest information on today's continuously variable transmissions (CVTs). In past issues of GEARS we've covered the details for Chrysler's CVT, the JF011E; and we've provided you with a basic understanding of how Ford's CVT, the CFT30, operates.

In this issue, we'll cover pressure related problems. They're common, and you'll defiantly be working on this unit very soon so be prepared.

Pressure Problems

Like many CVTs, Ford's CFT30 operates on much higher pressures than traditional transmissions. CFT30 operating pressures will usually be in the range of 220-250 PSI, but can exceed 1000 PSI at times.

The CFT30 has no external pressure ports; the only way to check the operating pressure is to monitor the main pressure sensor (PCA MES) and secondary pressure sensor (PCC MES) PIDS with a scan tool. If the TCM detects pressures out of range, the TCM will set one of these codes:

- P0840 — main pressure sensor out of range
- P0845 — secondary pressure sensor out of range
- P0868 — transaxle pressure low
- P0871 — secondary pressure low
- P0961 — PCA out of range

Ford claims these codes can be caused by faulty pressure control solenoids, faulty pressure sensors, a faulty Mechatronic assembly (valve body/TCM assembly); all of which are caused by either a faulty Mechatronic assembly, at a cost of over $1100 P&L, or an internal leak in the hydraulic system.

KEEP THOSE TRANNYS ROLLING

Figure 1: Mechatronic assembly with feed tubes

4
This sucks.
(And so does trying to build every transmission you sell.)

You don't have to build it to know it's built right.
You don't have to build it to save money.
You don't have to build it to sell it.
Stop letting tradition suck the profit out of your business. Use ETE REMAN.

No Hassle  Nationwide 3 year/unlimited mileage, parts and labor warranty.

No Worry  1,400+ different foreign and domestic transmissions for 16,000+ vehicle applications - for a lot less than you might think.

No Bull$#*% Easy ordering, fast delivery, and the industry's most helpful Customer Loyalty team.
Ford claims the only way to correct these problems is to replace the transmission. But we’ve found that the most common cause for these codes is an internal leak in the hydraulic system. And there are less expensive ways to repair those leaks.

The hydraulic system for the CFT30 is pretty simple. The CFT30 uses seven feed tubes to deliver pressure to the various transmission components. The Mechatronic assembly itself uses seven different feed tubes to deliver pressure to the case. They are (figure 1):

- Clutch supply feed tube
- Primary feed tube
- Secondary feed tube
- Main pressure feed tube
- (2) Torque converter clutch feed tubes
- Lube Tube

The Mechatronic assembly routes pressure through the case to the primary and secondary covers, located on the rear of the transmission (figure 2).

The primary variator and forward clutch circuit uses a feed tube located in the primary cover (figure 3) to control the primary variator and forward clutch operation.

The secondary variator circuit uses a feed tube located in the secondary cover (figure 4) and main case to control the secondary variator operation.

All of these feed tubes use sealing rings to seal each of the circuits.
The K82900Q (ZF6HP32) Rebuilding Kit
Additional new kits available from Precision International:

WITHOUT PRECISION, THEY CAN’T FINISH FASTER.

Our new K82900Q (ZF6HP32) Overhaul, Banner and Master Kits are the answers you need fast.
Sealing ring shrinkage, deterioration, or damage can cause hydraulic circuit leaks, which is becoming one of the most common causes for pressure codes to set on this unit.

The good part of the story is you can replace any of these feed tube sealing rings without completely disassembly the transmissions case. The question is, do you replace the $1100 Mechatronic assembly, or should you take a couple hours labor and a seal kit to repair or reseal the feed tubes, all in an effort to eliminate the pressure codes? Depending on the age of the vehicle and the condition of the transmission, resealing the tubes may be worth a shot.

**Resealing the Tubes**

The first step to resealing the feed tubes is to remove the Mechatronic assembly from the case. With the Mechatronic assembly removed, you’ll be able to see the seven feed tubes located in the Mechatronic assembly and/or stuck in the case as shown in figure 1.

Remove each of the feed tubes (identifying their locations for reassembly later) and replace the feed tube sealing rings. Be sure to coat the feed tubes and sealing rings with Ford CVT fluid prior to reinstalling the tubes in the case.

Install the Mechatronic assembly and transmission pan.

Next, remove the primary and secondary covers located at the rear of the transmission as shown in figure 2.

Remove the primary variator feed tube from the primary cover and replace the sealing rings as shown in figure 3.

Reinstall the primary variator feed tube into the primary cover and install the primary cover onto the main case.

Next, remove the secondary variator feed tube from the secondary cover and replace the sealing rings as shown in figure 4. Again, be sure to coat the sealing rings with Ford CVT fluid prior to installing the primary and secondary covers.

Once you’ve reinstalled the primary and secondary covers, check the fluid level and refill as needed. Clear all codes from the computer system and road test vehicle to recheck transmission operation. If the pressure codes return, you’ll need to replace the Mechatronic assembly.

Replacing the Mechatronic assembly is pretty straightforward: Remove the transmission pan, then remove and replace Mechatronic assembly.

Reinstall the transmission pan, check and refill transmission as needed. Clear the codes from the computer system.

With the new Mechatronic assembly installed, you’ll have to reflash the vehicle with the latest update. After the reflash, test drive vehicle to make sure the transmission is operating properly.

**IMPORTANT:** We’ve encountered pump problems and sealing ring leaks in the forward clutch circuit. These repairs will require you to disassemble the transmission.

Well, there you have it: a quick and simple way to take care of Ford CFT30 pressure problems. With a little patience and a better understanding of the CFT30 transmission, you should have no problem keeping those CVT trannies rolling down the road.
The New Product Development Team at Seal Aftermarket Products ensures that the metal clad seals in the Toledo Transkits™ rebuild kits are the highest quality rubber material available in the aftermarket and may be more tolerant of temperatures than the original equipment seal. A higher grade rubber compound is extremely important as the aftermarket has the benefit of knowing the wear characteristics of the original and depends on a better sealing solution for the continued life of the transmission.

High quality metal clad seals can be found in the following Toledo Transkit™ rebuild kits:

- T45002AP Ohk BL45/50 with pistons 06-Up
- T45002A Ohk BL45/50 without pistons
- T45004A Master less steels GL45/50
- T46006A Master with steels BL45/50
- T46002CP Ohk BL80 with pistons 06-Up
- T46002C Ohk BL80 without pistons
- T46004C Master less steels BL80
- T46006C Master with steels BL80
- T46002DP Ohk BL90 with pistons 07-Up
- T46002D Ohk BL90 without pistons
- T46004D Master less steels BL90
- T46006D Master with steels BL90
